Introduction of the Project

Cxcx

This is the **starting point** of your project report. It tells the reader what your project is, what it does, and what it is made for. You should explain **what type of website** you created using HTML, CSS, and Bootstrap — for example, a restaurant website, a travel website, a school website, or a product landing page.

What to include:

- What your website is about.
- What users can see or do on it.
- Why you decided to make this type of website.

Example (Simple Restaurant Website):

This project is a simple restaurant website designed using HTML, CSS, and Bootstrap. The main purpose of the website is to show information about the restaurant, its menu, gallery, and contact details. The project helped me learn how to build and style web pages and how to make them look good on different screen sizes.

Project Objective

Cc

The project objective means **what you wanted to achieve** by creating this website. It explains your **main goals** — for example, learning frontend design, making a responsive layout, or understanding how to publish a website online.

What to include:

- What you wanted to learn or practice.
- What the website should achieve for users.

Example:

The objective of this project is to design and develop a clean, attractive, and responsive website using HTML, CSS, and Bootstrap. The goal is to provide users with easy access to information while also helping me learn how to create professional-looking web pages and host them using GitHub Pages.

Background Problem

S

This section describes the **reason behind creating your website**. Every project starts with a problem or need.

This is where you explain what **issue or gap** your website is solving.

What to include:

- What problem existed before the website.
- Why you thought of making it.

Example (for Restaurant Site):

Many small restaurants do not have an online presence, so customers cannot see their menu or contact details easily. This project was made to solve this issue by creating a simple website that shares all restaurant information in one place.

Example (for Travel Website):

People often find it difficult to get complete travel details in one place. This website helps visitors find travel destinations, tour packages, and contact information easily.

Project Purpose

C

The project purpose means **what your website is used for** — the main aim of the website and how it helps users.

What to include:

- What your website provides or shows.
- Who will use it (visitors, customers, students, etc.).

Example:

The purpose of this project is to provide visitors with a simple and clear platform to view restaurant information, menu items, and contact details. It helps customers know more about the restaurant before visiting. It also helps the owner promote their business online.

Development Effort Triggered Requirement

Perform after mid so don't do it in mid term

This means new requirements or ideas that appeared during development — things you added or changed while building the website because you realized they would make it better.

What to include:

- What changes you made after you started coding.
- Why you decided to add them.

Example:

When the project started, the plan was to create only a simple one-page website. But during development, new ideas came up. I added a navigation bar with links to different sections, used Bootstrap to make the website responsive, and added hover effects to make the design more interactive. These new features were added to improve the user experience and visual design.

Tip:

These are features that are “triggered” or “discovered” when you start working — like realizing you need a contact form, image gallery, or mobile-friendly layout.

Languages & Technologies Used

C

Here, list all the tools, languages, and frameworks you used to make your website.

What to include:

- HTML → for structure
- CSS → for design
- Bootstrap → for layout and responsiveness
- GitHub → for hosting and sharing

Frontend	HTML CSS Bootstrap 5
Github Uploaded Status	YES/NO
Github Website Live Status	YES/NO
Other things	

Project Features

Z

This section explains what your website contains and can do — the main pages, buttons, sections, and visual features.

 What to include:

- List of all pages and sections.
- Mention any special features (hover effects, animations, responsive layout, etc.).

 Example:

- “Home Page with welcome message and navigation bar.”
- “About Page describing the business or service.”
- “Menu or Services Page showing items or features.”
- “Contact Page with form and location details.”
- “Fully responsive design using Bootstrap.”
- “Attractive color scheme and hover animations.”

Plan Of Work

B

This shows how you completed your project step by step — from the start to final publishing. It helps teachers understand your working process.

 What to include:

1. Planning the design layout on paper or using Figma.
2. Creating HTML pages (Home, About, Contact, etc.).
3. Styling with CSS and Bootstrap.
4. Testing responsiveness on mobile and desktop.
5. Uploading all files to GitHub.
6. Hosting the project using GitHub Pages.

 Example:

The project began with planning the website layout and selecting color combinations. Then, HTML pages were created for different sections. CSS and Bootstrap were added to make the site attractive and mobile-friendly. After testing the design, the project files were uploaded to GitHub, and the website was made live using GitHub Pages.

Contribution of Each Person

B

If your project was done in a **group**, mention what each person did.

If it was done **individually**, mention that you completed all parts yourself.

✓ What to include:

- Team members' names and their work roles.

💡 Example (Group Project):

- "Huzaifa: Created HTML structure and linked pages."
- "Ali: Designed CSS styles and color theme."
- "Sana: Added Bootstrap classes for responsiveness."
- "Hamza: Managed GitHub repository and hosted the website."

Description or Idea of Project Activities:

Idea of creating Electoral E_Voting System is gathered with the help of real life examples which is observed during the election and for that decided to make Online system of Vote Casting as well as Managing all the activities or procedure of Election System Online.

Information Gathering:

(Link of the references/resources to create the project)

1. Number of classes with their attributes is designed.
2. Several Google and Research papers searches are performed for GUI with User friendly interface knowledge.

Department of Computer Science

Group Members	Contribution of each person
Huzaifa	1. Idea for Project Activities and Designer. 2. Gathered information, designing and implementing with both team members. 3. Partial Work of Project Report Writing (SQL QUERY FOR EACH OPERATION) 4. Database Backend Work. 5. Front Interface Designing (GUI).
Haris	1. Gathered information, designing and implementing co_member. 2. Partial Work of Project Report Writing (Project Scheduling) 3. Database Backend Work. 4. Front Interface Designing (GUI).
Usama	1. Gathered information, designing and implementing co_member. 2. Partial Work of Project Report Writing (Introduction, ER Diagram, Conclusion, Future Expansion, SQL OPERATIONS USED IN THE PROJECT)

Project GitHub Repository Link

M

Perform after mid so don't do it in mid term

This is where you show your GitHub repository link and live hosted site link.

What to include:

- Repository link → <https://github.com/username/project-name>
- Live site link → <https://username.github.io/project-name/>

Example:

- "GitHub Repository: <https://github.com/Huzaifa71/restaurant-website> ↗"
- "Live Website: <https://huzaifa71.github.io/restaurant-website/> ↗"

User Guide With Snapshots

Perform after mid so don't do it in mid term

This section shows how your website looks and how to use it, with screenshots and short descriptions.

What to include:

- Steps to open or use the website.
- Screenshots (Home page, About page, Contact page, etc.).
- One-line explanations for each screenshot.

Example:

Home Page: Shows welcome banner and main navigation.

Menu Page: Displays available dishes and prices.

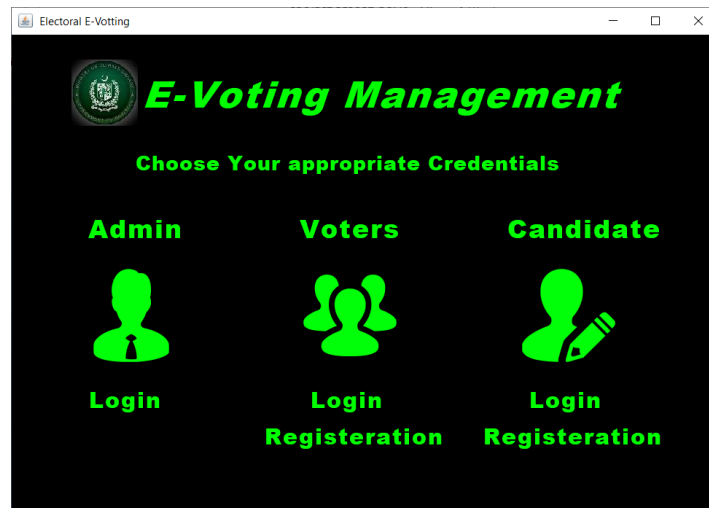

Contact Page: Allows users to send messages and view location map.

Tip:

Take screenshots of your website pages after running them on GitHub Pages or browser preview and paste them in your report.

Department of Computer Science

Panel_View for Login and Registration**(Admin Procedure Demonstration)****Flowchart/System flow diagram**

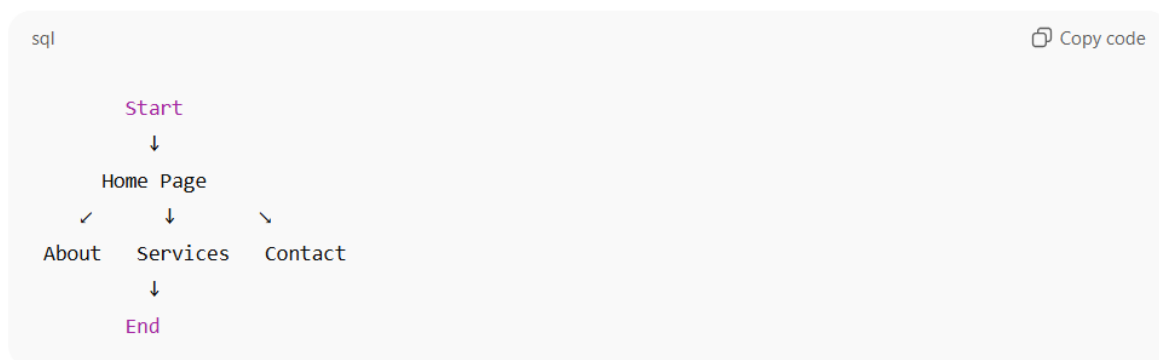

Perform after mid so don't do it in mid term

C

A simple flow diagram that shows how a user moves through your website.

You can draw it in PowerPoint, Word, or online tools like draw.io.

✓ Example Flow (for a simple website):

💡 Tip:

You don't need complex flowcharts — just show how users go from Home to other pages and back.

Conclusion

B

This section explains **what you achieved and learned** by making the project. It's like a short reflection at the end.

 What to include:

- What skills you learned.
- How the project helped you understand web development.

 Example:

This project helped me understand how to create a complete website using HTML, CSS, and Bootstrap. I learned how to design responsive layouts, link pages, and host websites on GitHub Pages. The project improved my creativity, problem-solving, and understanding of web technologies.

Future Expansion

B

This section shows **how you plan to improve or upgrade your project in the future**. It tells the reader that your project can grow further.

 What to include:

- Features you want to add later.
- How you will make it more useful or attractive.

 Example:

In the future, I plan to add JavaScript for interactivity such as image sliders and form validation. I also want to create a login page and connect the website with a database to store user messages. Additionally, I plan to add animations and a dark mode for better user experience.

Would you like me to create a **fully written example report (ready to edit in Word)** for a sample project (e.g., "Restaurant Website" or "Travel Website") using this structure and wording?

You could then easily replace the names, screenshots, and GitHub links with your own.
